

SMART INDIA HACKATHON 2026

TRACESETU

- **Problem Statement ID – 26182**
- **Problem Statement Title – Automated Attribution of Unknown Cryptocurrency Wallets to Nearest Virtual Asset Service Providers (VASPs) through Blockchain Intelligence APIs**
- **Theme – Blockchain & Cybersecurity**
- **PS Category – Software**
- **Team ID – 170835**
- **Team Name – ANANTHA**

❖ Proposed Solution (Describe your Idea/Solution/Prototype)

- Solution: trace a reported wallet to the first supported exchange or custodian on each path, with a graph and evidence.
- Problem addressed: help officers locate the receiving service and prepare an independently reviewed request for a verified recipient.
- USP: a nearestness certificate shows gaps that could change the answer. Challenge a source and run the next query within a hard budget.

- Technologies: React / TypeScript, Cytoscape.js, Python / FastAPI, SQLAlchemy, SQLite WAL and ReportLab.
- Methodology: fetch and hash data, trace the first custodian per path, inspect gaps, review requests and verify signed exports.
- Adapters: Bitcoin, Ethereum, Tron, BNB Chain, Solana and Polygon. Broader live validation remains pending.

- Feasibility: working local MVP, 116 backend tests passed and real Bitcoin acquisition with verified evidence replay.
- Challenges: incomplete history, uncertain service labels, API quotas and unvalidated broad multi-chain coverage.
- Mitigation: preserve gaps, challenge sources, cap calls and require independent review. SAHYOG access remains pending.

- Target users: LEA investigators and reviewers. Show the first supported receiving service, its evidence and the next action.
- Expected benefits: less manual tracing, fewer misdirected requests and clearer case records. Field evaluation remains pending.
- Live WannaCry case: two Bitcoin transactions, three outputs and no supported receiving VASP.
